

## CASE STUDY

### *Siltbuster* – Bricking it !

Ibstock Brick Limited is a leading manufacturer of high quality clay facing bricks and paving. It has particular expertise in the manufacture of special shaped bricks, often to the architect's own design. Ibstock is also a major producer of architectural terracotta, faience and cast stone. Its products are to be seen on all types of buildings from civic centres to family homes.

Ibstock's origins go back some 170 years. Many of its sites have a history of working with natural materials from the uncontrolled operating conditions of the Industrial Revolution right up to today's climate of environmental protection and conservation.

When their site at Tannochside, near Glasgow wanted to treat the effluent from their Special Shaped Brick Cutting Operations they called in *Siltbuster*.

The *Siltbuster* was delivered to site in mid July 2003 and was installed adjacent to the factory's existing settlement pond (see opposite). Cooling water from six clipper saws used to cut facing bricks into angles was redirected into the *Siltbuster* for treatment prior to discharge to sewer.
